Plain concrete made with medium gray cement.

WHEN CHOOSING YOUR COLOR. . .

The color chips depicted in this color selector show the approximate color of broom-finished, fully cured decorative concrete flatwork made with a medium gray cement, and a 0.45 to 0.50 water-cement ratio. Decorative concrete cured with Cemstone Supply Cure and Seal curing compound will be slightly darker in appearance. There are many factors that can impact the finished appearance of in-place decorative concrete. Concrete has a natural variation in appearance similar to marble, granite and wood. The in-place concrete will be affected by the concrete mixture including materials selected, finishing techniques, curing & sealing methods as well as other factors such as weather conditions

CAUTION

Sample panels best represent the in-place appearance and are strongly recommended. These panels are the best method of ensuring that the final in-place concrete will not only be the correct color choice, but also the finish that will meet the owner's expectations. Since concrete takes 28 days to cure, reviewing sample panels prior may not represent the final cured appearance.
